

PURE™ Sustainability

METERING MODULE

Monitor and React to Your Changing Utility Usage in Real-Time

This module builds on the standard PURE™ Platform metering functionality by supporting automated and real-time data gathering, monitoring and reporting across thousands of meters. The module collects data from electricity, gas and water meters from a variety of sources and presents the data in a unified manner. This flexibility is important when working with meter data which can be stored in a range of formats (e.g. CSV, MS Excel, EDI, XML) and transferred in a range of ways (e.g. email, sFTP, web service or custom API).

KEY BENEFITS & FEATURES

- **Automate Data Collection from Multiple Sources** – The Metering module gives you complete oversight of your various data sources and helps manage the gathering process by flagging data gaps or where information is being presented for meters you haven't accounted for.
- **Use Alarms to Monitor Consumption** – By setting thresholds and alarms across your business, you can track and respond to any unusual activity as well as compare usage trends across your enterprise. You can configure the alarm thresholds and ensure the relevant people receive automated notifications when alarms are triggered.
- **View Performance at all Frequencies** – All data is aggregated into the main PURE™ system to form part of your wider reporting requirements at the monthly/quarterly/ annual level. The Metering module provides high frequency analytical tools to look at 'intra-day' consumption and compare multiple meters on a single chart.
